## Abstracts

According to our (Global Info Research) latest study, the global High-Entropy Alloy Targets market size was valued at US\$ 405 million in 2025 and is forecast to a readjusted size of US\$ 703 million by 2032 with a CAGR of 8.1% during review period.

High entropy alloy target material is an advanced coating material composed of five or more main component metals mixed in nearly equal atomic ratios. Its unique composition design endows it with high hardness, corrosion resistance, and excellent thermal stability, making it an ideal choice in the field of magnetron sputtering (PVD coating technology). Application: Research on Thin Film Materials: High entropy alloy targets can be used to prepare high-quality thin film materials, such as for optoelectronic devices, sensors, and microelectronic devices. Corrosion resistant coating: Coatings prepared from high entropy alloy targets have excellent corrosion resistance and can be used in fields such as aerospace, chemical, and marine engineering. Optical materials: High entropy alloy targets have a wide range of applications in the field of optical materials, such as the preparation of high refractive index optical films, mirrors, and lenses. In 2025, global High-Entropy Alloy Targets production reached approximately 67 Tons, with an average global market price of around US\$ 5,879 per kg. The annual production capacity of high entropy alloy target material is 100 tons, with a gross profit margin of about 45%.

In terms of cost structure, it mainly consists of raw material costs, preparation and processing costs, testing and certification costs, and research and development expenses. Among them, multi-element high-purity metal raw materials account for the highest proportion of about 40% to 60%, vacuum melting or powder metallurgy processing costs account for about 15% to 25%, testing and quality control costs

account for about 10% to 15%, and research and development and formula design costs account for about 10% to 20%.

The upstream of the industrial chain mainly includes suppliers of high-purity metal raw materials, powder material manufacturers, and vacuum metallurgy equipment enterprises. The midstream includes research and manufacturing enterprises of high entropy alloy target materials, while the downstream covers semiconductor thin film deposition enterprises, display panel manufacturers, tool and mold coating enterprises, as well as aerospace and research institutions. The overall industrial chain presents the characteristics of strong upstream resource dependence, high technical barriers in the midstream, and downstream applications still in the expansion stage.
