The global High-Fidelity Patient Simulator market size is expected to reach \$ 450.6 million by 2029, rising at a market growth of 10.3% CAGR during the forecast period (2023-2029).

Factors contributing to the high-fidelity patient simulator market growth include increasing demand for minimally invasive surgeries and robotic surgical systems, technological advancements in simulation solutions, expanding scope of applications in military and defense sector, increasing focus on improving patient safety and reducing healthcare costs, rising adoption of serious games and virtual reality, and growing need for hands-on experience in laparoscopic and endovascular surgeries.

A high fidelity patient simulator, also known as a human patient simulator (HPS), is a medical training tool that replicates realistic physiological and pathophysiological responses to create scenarios for healthcare professionals to assess, diagnose, and treat. HPS devices are typically used in nursing education or emergency medicine to teach skills such as intubation, ventilation management, cardiac resuscitation techniques and other critical care procedures. The typical simulation features computerized manikins with programmed vital sign changes, and the ability to run complex clinical cases which can be recorded & debriefed by educators.
