According to our (Global Info Research) latest study, the global High Frequency Circuit Inductors market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

High-frequency circuit inductors are passive components that store energy in a magnetic field and are used in high-frequency circuits. They are typically made of a coil of wire and a core material, and are used to filter or transform high-frequency signals in electronic devices, such as radios, televisions, and computers. The inductance of an inductor is directly proportional to the number of turns in the coil and the permeability of the core material. High-frequency inductors have unique characteristics compared to inductors operating at lower frequencies, and their design and construction must take into account factors such as self-resonance, skin effect, and proximity effect.
