According to our (Global Info Research) latest study, the global High Frequency Grinder market size was valued at US\$ 400 million in 2024 and is forecast to a readjusted size of USD 505 million by 2031 with a CAGR of 3.4% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

A High Frequency Grinder is a grinder connected to a high-frequency generator (inverter power supply) that enhances pressure. Basically, it has a high output, which makes it suitable for steel and uneven material surfaces. In addition, with general grinders, high friction on the surface to be ground causes a decrease in rotational speed, resulting in uneven grinding. A high-frequency grinder, however, is capable of maintaining a constant output voltage, which is another feature that allows for uniform grinding. Handheld types are the mainstream, and there is no significant difference in disc size. On the other hand, work capacity varies greatly depending on the specifications of the inverter power supply.
