High-Frequency Hyperthermia Device is a medical device that uses heat generated by high-frequency electromagnetic waves to treat cancer. This device applies high-frequency current to cancerous tissue to generate local temperature rise, thereby enhancing the sensitivity of tumor cells and improving their response to radiotherapy or chemotherapy. High-frequency thermal therapy controls temperature and treatment time to ensure accuracy and safety during the treatment process. The goal of this technology is to directly kill cancer cells, inhibit tumor growth, or enhance the effectiveness of other treatments through thermal effects.
