The global High Frequency Induction Power Supply market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

High Frequency Induction Power Supply is a type of electrical power supply that is used for the purpose of inducing a high-frequency magnetic field into a metallic object. This type of power supply is commonly used in industrial settings for the heating, melting, or surface hardening of metals, such as steel or aluminum. The power supply works by generating a high-frequency current that is passed through a coil of wire, which generates a high-frequency magnetic field. This magnetic field is then used to induce eddy currents within the metal being treated, which generates heat and causes the desired transformation or treatment to occur.
