High-frequency trading refers to computerized trading that seeks to profit from very short-lived market changes that people cannot take advantage of, such as small changes in the difference between the bid and ask prices of a security, or the small spread between different exchanges for a stock. The speed of such transactions is so fast that some trading institutions place their 'server farms' close to the exchange's computers to shorten the distance that trading instructions travel at the speed of light through fiber-optic cables.
