Abstracts

High intensity focused ultrasound (HIFU) therapy kills cancer cells with high frequency sound waves. It can treat only a single tumor or a part of a large tumor and cannot be used to treat widespread tumors. Thus, the HIFU therapy is not suitable for the treatment of malignant tumor. This therapy is a novel, emergent and practices ultrasound waves that propagate through tissue media as energy carriers. HIFU therapy is a completely non-invasive technology that has great potential of tumor ablation, hemostasis, thrombolysis as well as targeted drug/gene delivery.
