## Abstracts

The global High-Iodine Coconut Shell Activated Carbon market size is expected to reach \$ 823 million by 2032, rising at a market growth of 4.7% CAGR during the forecast period (2026-2032).

High-Iodine Coconut Shell Activated Carbon refers to a high-performance porous carbon material with an iodine adsorption value of  $\geq 1,000$  mg/g. Produced primarily from high-quality carbonized coconut shell material, it undergoes processes such as high-temperature steam activation, screening, and washing (with water or acid).

Characterized predominantly by a microporous structure, the product typically features a large specific surface area, high adsorption capacity, high mechanical strength, low ash content, and minimal impurities; it is primarily used in liquid- and gas-phase purification applications that demand superior adsorption performance, high purity, and long service life.

The upstream segment of the industry chain primarily involves mature coconut shells, carbonized coconut shell material, process water, steam, and washing agents such as hydrochloric acid. Notably, the fixed carbon, ash, volatile matter, and impurity levels of the carbonized coconut shell material directly influence the final product's iodine value, hardness, and yield. Midstream enterprises manufacture various grades of the product through crushing, carbonization, steam activation, screening, washing (water or acid), drying, and packaging, while implementing quality control based on parameters such as iodine value, particle size, ash content, hardness, pH, and apparent density. The downstream market is anchored by municipal water supply and household water purification, extending into industrial sectors such as food and beverage, petrochemicals, and ultrapure water for electronics.

In 2025, global sales volume is approximately 190,000 metric tons, with an average selling price of around US\$2,900–3,200 per ton and gross profit margins for major manufacturers ranging from 25% to 35%.
