## Abstracts

According to our (Global Info Research) latest study, the global High Molecular Permanent Antistatic Agent market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The High Molecular Permanent Antistatic Agent is a chemical compound used to impart antistatic properties to various materials, typically in the form of polymers or textiles. It is a high molecular weight substance that is added during the manufacturing process to reduce or eliminate the build-up of static electricity on the surface of the material. The antistatic agent forms a thin, conductive layer on the surface, allowing the dissipation of static charges by providing a pathway for the electrical current to flow. This helps to prevent issues such as electrostatic discharge (ESD), dust attraction, and fabric clinging, making it valuable for industries like electronics, textiles, packaging, and automotive.

The industry trend for High Molecular Permanent Antistatic Agents is driven by the increasing demand for advanced antistatic solutions that offer long-lasting performance and environmental compatibility. Manufacturers are focusing on developing agents with high permanence, meaning they retain their antistatic properties even after prolonged use or repeated washing. Additionally, there is a growing emphasis on creating antistatic agents that are free from hazardous chemicals and comply with environmental regulations. The industry is also exploring the incorporation of antistatic agents into sustainable and recyclable materials, aligning with the broader trend toward eco-friendly and socially responsible practices. Moreover, advancements in nanotechnology and surface modification techniques are being explored to enhance the effectiveness and

durability of these agents.
