According to our (Global Info Research) latest study, the global High-Performance Electronic Adhesives market size was valued at US\$ 5814 million in 2025 and is forecast to a readjusted size of US\$ 10079 million by 2032 with a CAGR of 8.0% during review period.

High-Performance Electronic Adhesives refer to functional adhesive materials used in high-reliability electronics manufacturing, including electronic components, printed circuit boards, semiconductor packaging, power modules, display modules, sensors, automotive electronics and communication equipment. These products are generally based on epoxy, silicone, acrylic, polyurethane and modified resin systems, and are supplied as one-component or two-component liquids, pastes, adhesive films, conductive adhesives, thermally conductive adhesives, underfills, potting compounds, encapsulants, SMT adhesives and optically clear adhesives. Their core functions include bonding, fixing, insulation, moisture protection, corrosion resistance, stress relief, thermal management, electrical conductivity and long-term reliability protection.

Major production and technology supply regions for High-Performance Electronic Adhesives include the United States, Germany, Japan, South Korea, China, Taiwan, China and selected Southeast Asian markets. Companies from the United States, Germany and Japan retain strong advantages in semiconductor packaging, conductive and thermally conductive materials, and high-reliability electronic protection systems, while Chinese suppliers are expanding rapidly in consumer electronics, photovoltaic electronics, automotive electronics, battery-related electronic components and import substitution. Typical applications include die attach, flip-chip underfill, chip-scale package protection, component potting, PCB assembly protection, camera module

fixing, display module bonding, power device thermal bonding, automotive electronics sealing and flexible bonding for wearable devices.

In 2025, global High-Performance Electronic Adhesives production reached approximately 115,000?130,000 metric tons. The average FOB price was approximately USD 42.0?52.0 per kg, with semiconductor underfills, die attach adhesives, silver-filled conductive adhesives, high-thermal-conductivity power device adhesives and optically clear adhesives priced significantly above general electronic fixing adhesives and standard potting compounds.

High-Performance Electronic Adhesives are evolving from auxiliary assembly materials into critical materials that determine reliability, thermal efficiency and packaging performance in electronic products. Driven by artificial intelligence servers, high-performance computing, advanced packaging, automotive electronics, power semiconductors, 5G communication equipment, wearable devices and premium consumer electronics, electronic systems are becoming more compact, while component power density and thermal load continue to increase. This creates higher requirements for thermal conductivity, insulation, low stress, moisture resistance, thermal cycling resistance, low ionic content and long-term stability. In semiconductor packaging and power devices in particular, underfills, die attach adhesives, thermally conductive adhesives and conductive adhesives are no longer simple process consumables; they have become core materials affecting device yield, service life and system reliability.

Global market opportunities are mainly supported by the shift toward high-density, high-power and high-reliability electronics manufacturing, but the industry still faces high technical barriers and supply chain risks. High-end electronic adhesives must be closely matched with customers' package designs, process windows, dispensing equipment, curing conditions and reliability validation systems, resulting in long qualification cycles and high switching costs. This allows leading international suppliers to maintain strong positions in premium applications. At the same time, price fluctuations in silver powders, thermally conductive fillers, high-purity resins, specialty curing agents and key additives can affect margins and supply stability. Looking ahead, competition will center on advanced packaging materials, automotive-grade electronic adhesives, low-temperature fast curing, reworkable materials, low-volatility and low-ionic formulations, high-thermal-conductivity insulating systems and localized supply capabilities. Companies with strong formulation know-how, reliability testing capabilities and joint development relationships with customers are expected to capture higher growth potential.
