According to our (Global Info Research) latest study, the global High Precision Inertial Navigation GNSS Receiver market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

A High Precision Inertial Navigation GNSS Receiver is a device that combines the Global Navigation Satellite System (GNSS) technology with the Inertial Navigation System (INS) technology to provide accurate and reliable position, velocity, and attitude information for various applications. GNSS is a system that uses satellites to provide geolocation and time information to a receiver anywhere on or near the Earth. INS is a system that uses sensors such as accelerometers and gyroscopes to measure the motion and orientation of a platform relative to an initial reference frame. By integrating GNSS and INS, the device can overcome the limitations of each system and enhance the performance and robustness of the navigation solution. For example, GNSS can provide absolute position and velocity information, but it may be unavailable or degraded in some environments such as urban canyons, tunnels, or under foliage. INS can provide continuous position and attitude information, but it may suffer from drift and errors due to sensor noise and bias. By fusing the data from both systems, the device can correct the errors of each system and provide a consistent and accurate navigation solution even in challenging environments.
