High pressure axial piston pumps are hydraulic pumps composed of key components including the cylinder block, swash plate, pistons, and the inclined plate. The unique feature of these pumps is that the pistons are arranged axially, meaning their centerlines are parallel to the drive shaft. Unlike reciprocating piston pumps, the pistons in high pressure axial piston pumps not only reciprocate within the pump cylinder but also rotate relative to the cylinder and swash plate. The pistons make contact with the inclined plate through their spherical end, facilitating efficient hydraulic transfer. These pumps are widely used in hydraulic systems that require high pressure and high efficiency.
