Abstracts

The global High Pressure Dry Powder Briquetting Machine market size is expected to reach \$ 2107 million by 2032, rising at a market growth of 4.1% CAGR during the forecast period (2026-2032).

A high-pressure dry powder briquetting machine is a device that uses high-pressure mechanical force to compress powdery materials (such as mineral powder, metallurgical by-products, and chemical powders) into briquettes or spheres. It typically consists of pressure rollers, a hydraulic system, a transmission system, and forming molds. This equipment requires no binder and directly presses the powder under high pressure, making it widely used in metallurgy, mining, and chemical industries. It solves the problems of direct utilization of powders, difficulties in transportation and storage, resource waste, and environmental pollution, achieving material reuse and energy conservation and emission reduction. The average price of this product is approximately US\$180,000 per unit, with global sales of approximately 8,500 units.

Upstream suppliers include raw material suppliers such as mineral powder, metallurgical by-products, chemical powders, and coal powder; midstream manufacturers produce briquetting machines using mechanical or hydraulic high-pressure forming technology; downstream users include metallurgical plants, mining enterprises, chemical plants, and energy companies, with demand concentrated on resource recycling and energy conservation and emission reduction. Future trends include intelligent control, automated production lines, and the use of green and environmentally friendly materials. With the advancement of carbon neutrality policies, the application of briquetting machines in resource recycling and industrial energy conservation will continue to expand.
