High-pressure gas gene gun is a bioengineering device used in gene transformation technology. It uses high-pressure gas to spray tiny particles (such as gold powder or tungsten powder) carrying target genes into cells at high speed, thereby achieving gene transformation and expression. The working principle of high-pressure gas gene gun is to accelerate the microparticles through high-pressure gas so that they can obtain enough kinetic energy to pass through the cell membrane and enter the cell. These microparticles are usually coated with DNA or RNA and can be used to transform plants, microorganisms or other types of cells.
