Abstracts

The global High Pressure GDI Fuel Pumps market size is expected to reach \$ 7928 million by 2032, rising at a market growth of 7.0% CAGR during the forecast period (2026-2032).

In 2024, global high pressure GDI fuel pumps production reached approximately 11,974K unit, with an average global market price of around USD 400 per unit. A factory gross profit of USD 120 per unit with 30% gross margin. A single line full machine capacity production is around 850K unit per line per year. downstream demand is concentrated in passenger vehicle, hybrid vehicle and light commercial vehicle. Modern GDI engines like Hyundai's Smartstream G1.6T use high-pressure fuel pumps to deliver precise pressurized gasoline directly into combustion chambers. This improves part-load efficiency, reduces emissions, and contributes to higher engine torque. A High Pressure GDI Fuel Pump is a specialized mechanical pump in modern engines that pressurizes gasoline to extreme levels (hundreds or thousands of PSI) and injects it directly into the combustion chamber for better fuel economy, power, and lower emissions, unlike older systems that sprayed fuel into the intake port. It works alongside an in-tank pump, drawing fuel and compressing it for precise, timed delivery to the injectors.
