According to our (Global Info Research) latest study, the global High Pressure and Cold Chamber Die Casting Machines market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

High pressure die casting (HPDC) is a process where molten metal is injected under very high pressure into premium steel molds (dies) in order to manufacture high precision die cast products. The die is designed to cast engineered shapes and complex features with great accuracy and consistent replication. There are two types of HPDC : hot chamber die casting and cold chamber die casting. With cold-chamber die casting, metal is first heated to achieve a molten state in a separate furnace. The molten metal is then transported to the casting machine and fed into the machine's chamber. The machine uses a pressurized plunger to force the molten metal into the mold cavity.

Cold chamber high pressure die casting technology is ideal for production of a diverse range of aluminium and magnesium automotive castings such as engine blocks, gearbox casings, oil sumps, engine mounts and structural parts like cross-car beams. It is widely used in other sectors to manufacture components in applications that range from the simplest – a lighting component – to the most demanding, such as aerospace engine parts.
