Abstracts

The global High Pressure Porosity and Permeability System market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

High Pressure Porosity and Permeability System is a testing apparatus used to measure the porosity and permeability characteristics of rock samples under high pressure conditions. The system typically consists of a cell or chamber that can be pressurized, a pump to inject fluids into the cell, and instruments to measure fluid flow rate and pressure. The test is conducted by placing a rock sample into the cell and applying pressure to it, simulating the conditions found at greater depths in the Earth's subsurface. Fluid is then injected into the cell at a known rate, and the pressure drop across the sample is measured. From these measurements, the porosity (the fraction of the total volume of the rock that is pore space) and permeability (the ability of fluids to flow through the rock) of the sample can be calculated. High Pressure Porosity and Permeability Systems are commonly used in the oil and gas industry to evaluate the potential of subsurface reservoirs for hydrocarbon production. They can also be used in geothermal energy development and in the study of how fluids move through rocks in natural systems such as aquifers.

This report studies the global High Pressure Porosity and Permeability System production, demand, key manufacturers, and key regions.
