High-pressure residual gas analyzer is an instrument used to analyze the composition and concentration of residual gas in a high-pressure environment. It is usually used to study and monitor gas leakage, gas reactions and changes in gas composition in high-pressure systems. The working principle of the high-pressure residual gas analyzer is to extract the gas from the high-pressure system into the analyzer for analysis. It usually includes the following main components: 1. Extraction system: used to extract gas samples from the high-pressure system and deliver them to the analyzer. Extraction systems usually include air pumps, gas pipelines and valves. 2. Analysis module: used to analyze and detect the extracted gas samples. Analysis modules usually include gas sensors, mass spectrometers, spectrometers or gas chromatographs, etc. 3. Control and display system: used to control the operation of the extraction system and analysis module, and display analysis results. Control and display systems usually include control panels, displays, and data logging functions.
