According to our (Global Info Research) latest study, the global High Purity Chrysene market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Chrysene is a polycyclic aromatic hydrocarbon with the chemical formula $C_{18}H_{12}$, consisting of four fused benzene rings. It is a natural component of coal tar and was first isolated and characterized from coal tar. It is also found in creosote at levels of 0.5–6 mg/kg. The English word 'chrysene' originates from the Greek χρυσός (chrysos), meaning 'gold', due to the golden yellow color of its crystals, which is considered to be the correct color and characteristic of the compound when isolated. However, high-purity chlorine is colorless, and the yellow color is due to its trace orange-yellow isomer tetracene, which is not easy to separate.
