Abstracts

The global High Purity Chrysene market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Chrysene is a polycyclic aromatic hydrocarbon with the chemical formula C₁₈H₁₂, consisting of four fused benzene rings. It is a natural component of coal tar and was first isolated and characterized from coal tar. It is also found in creosote at levels of 0.5–6 mg/kg. The English word 'chrysene' originates from the Greek χρυσός (chrysos), meaning 'gold', due to the golden yellow color of its crystals, which is considered to be the correct color and characteristic of the compound when isolated. However, high-purity chlorine is colorless, and the yellow color is due to its trace orange-yellow isomer tetracene, which is not easy to separate.

This report studies the global High Purity Chrysene production, demand, key manufacturers, and key regions.
