The global High-purity Electroplating Solution for Semiconductor market size is expected to reach \$ 1647 million by 2032, rising at a market growth of 10.4% CAGR during the forecast period (2026-2032).

High purity electroplating solution for semiconductors refers to an ultra-high purity electrolyte or chemical plating solution system used for wafer manufacturing and advanced packaging metal deposition. It consists of high-purity metal salts, acid-base buffering or complexation systems, additive systems, and ultrapure water. The goal is to achieve controllable deposition rate, strong filling ability, low defect and high reliability coating under extremely low particle and low metal impurity conditions. It is typically used for key structures such as copper interconnects, via filling, rewiring layers and bumps. In 2025, global High-purity Electroplating Solution for Semiconductor production reached approximately 71.54 K MT, with an average global market price of around US\$ 9,075 per MT.

The application of electroplating technology in semiconductor manufacturing is very extensive, from wafer manufacturing to packaging and testing, to the manufacturing of micro and nano devices, all of which are key process steps to improve product performance and reliability. The main salt, conductive salt, anodic active agent, buffering agent, and various additives (such as leveling agent, brightener, anti pinhole agent, etc.) contained in the electroplating solution have a significant impact on the electroplating function. These additives can improve the performance and electroplating quality of the coating. Each electroplating material has its specific applications and advantages, and choosing the appropriate electroplating material is crucial for improving the performance of semiconductor devices.

Electroplating technology plays a crucial role in semiconductor manufacturing. As a key functional material for interconnecting wafers, packaging substrates, and PCBs, it plays a crucial role in ensuring the electrical performance, mechanical performance, physical heat dissipation, reliability, and service life of end products, determining the two core goals of I/O density and transmission efficiency in various advanced processes.

As one of the core materials in the semiconductor manufacturing process, the performance of electroplating solution directly affects the quality of the final product. With the continuous development of semiconductor technology, the performance requirements for electroplating solutions are also constantly increasing, prompting relevant enterprises to innovate and improve the formulation and technology of electroplating solutions. At present, the electroplating and plating solutions in the advanced packaging field in China are almost monopolized by foreign-funded enterprises. According to the different plating solution products, the competitive pattern of the domestic and foreign electroplating solution markets also shows a hierarchical feature. Domestic semiconductor companies started late in this field, and coupled with the extremely long certification cycle of this supply chain, the variety of products, and the high technical threshold, foreign companies are still the main players in this industry chain. In recent years, driven by the demand for industrial chain localization, Shanghai Xinyang has achieved zero breakthroughs in high-purity electroplating copper mother liquor and Damascus electroplating copper, Chuangzhi Xinlian has achieved wafer level nickel palladium gold plating, TSV electroplating copper, cyanide free electroplating gold plating, and Anji has achieved zero breakthroughs in advanced packaging electroplating copper products and other coating materials, accelerating domestic substitution.
