Abstracts

The global High Purity Electroplating Solution market size is expected to reach \$ 1659 million by 2032, rising at a market growth of 10.5% CAGR during the forecast period (2026-2032).

High purity electroplating solution refers to a high-purity metal deposition solution system used in electrolytic or chemical plating processes, usually composed of high-purity metal salts or complex salts, conductive salts or buffer systems, additives such as accelerators, inhibitors, leveling agents, brighteners, and ultra-low impurity solvents and stable components. Its core goal is to reduce metal ions to a dense and uniform coating at a controllable rate during the deposition process, while controlling particles, organic pollutants, metal impurities, halogens and sulfur impurities at a very low level to reduce the risk of pinholes, nodules, inclusions, roughness increase and reliability failure; Typical applications include wafer level and advanced packaging interconnect copper filling and RDL copper pillars, through hole and blind hole filling of carrier boards and PCBs, nickel gold or nickel palladium gold finishing of connectors, as well as high reliability electronic and precision hardware surface treatment. The key evaluation indicators of high-purity electroplating solutions are usually focused on metal impurities and particle levels, additive stability and batch consistency, deposition stress and ductility, hole filling ability and coverage uniformity, as well as long-term solution life and maintainability. In 2025, global High Purity Electroplating Solution production reached approximately 88.06 K MT, with an average global market price of around US\$ 9,042 per MT.

The application of electroplating technology in semiconductor manufacturing is very extensive, from wafer manufacturing to packaging and testing, to the manufacturing of micro and nano devices, all of which are key process steps to improve product

performance and reliability. The main salt, conductive salt, anodic active agent, buffering agent, and various additives (such as leveling agent, brightener, anti pinhole agent, etc.) contained in the electroplating solution have a significant impact on the electroplating function. These additives can improve the performance and electroplating quality of the coating. Each electroplating material has its specific applications and advantages, and choosing the appropriate electroplating material is crucial for improving the performance of semiconductor devices.

Electroplating technology plays a crucial role in semiconductor manufacturing. As a key functional material for interconnecting wafers, packaging substrates, and PCBs, it plays a crucial role in ensuring the electrical performance, mechanical performance, physical heat dissipation, reliability, and service life of end products, determining the two core goals of I/O density and transmission efficiency in various advanced processes.

As one of the core materials in the semiconductor manufacturing process, the performance of electroplating solution directly affects the quality of the final product. With the continuous development of semiconductor technology, the performance requirements for electroplating solutions are also constantly increasing, prompting relevant enterprises to innovate and improve the formulation and technology of electroplating solutions. At present, the electroplating and plating solutions in the advanced packaging field in China are almost monopolized by foreign-funded enterprises. According to the different plating solution products, the competitive pattern of the domestic and foreign electroplating solution markets also shows a hierarchical feature. Domestic semiconductor companies started late in this field, and coupled with the extremely long certification cycle of this supply chain, the variety of products, and the high technical threshold, foreign companies are still the main players in this industry chain. In recent years, driven by the demand for industrial chain localization, Shanghai Xinyang has achieved zero breakthroughs in high-purity electroplating copper mother liquor and Damascus electroplating copper, Chuangzhi Xinlian has achieved wafer level nickel palladium gold plating, TSV electroplating copper, cyanide free electroplating gold plating, and Anji has achieved zero breakthroughs in advanced packaging electroplating copper products and other coating materials, accelerating domestic substitution.
