## Abstracts

According to our (Global Info Research) latest study, the global High Purity Indium Trichloride market size was valued at US\$ 350 million in 2024 and is forecast to a readjusted size of USD 461 million by 2031 with a CAGR of 4.1% during review period.

Indium trichloride ( $\text{InCl}_3$ ) is a white, odorless, highly soluble powder. Its particles are in the form of flakes or disks, highly soluble in water and inorganic acids. Indium trichloride can be used to prepare other inorganic and organic indium compounds, such as TMI (trimethylindium). TMI is the most widely used precursor metal organic compound, mainly used for the production of indium containing composite metal compounds. Indium trichloride is also used as an additive in alkaline batteries, which can reduce gas emissions and improve battery efficiency under load. Indium Tai provides anhydrous powder products of indium trichloride and saturated solution products. Indium trichloride has a wide range of applications and is a necessary material for various industries, including the manufacturing of LEDs, lighting, and semiconductor components.

With the evolution of semiconductor technology towards the micro nano and even atomic levels, the quality control requirements for indium trichloride used in trimethylindium will become more stringent. In the future, in addition to improving the purity of raw materials, the industry will pay more attention to green and safe production methods, develop harmless treatment processes and recycling technologies. In addition, with the widespread application of compound semiconductors in emerging fields such as 5G communication, new energy vehicles, and photovoltaic industry, the market for indium trichloride for trimethylindium will maintain a strong growth trend.
