Abstracts

According to our (Global Info Research) latest study, the global High-Purity PLGA Polymers for Long-Acting Injectables market size was valued at US\$ 74.08 million in 2025 and is forecast to a readjusted size of US\$ 169 million by 2032 with a CAGR of 12.3% during review period.

In 2025, global sales volume of high-purity pharmaceutical-grade PLGA polymers for injectable long-acting formulations reached approximately 4.8 metric tons, with an average selling price of around US\$15,000/kg and a market size of approximately US\$72 million. High-purity pharmaceutical-grade PLGA polymers for injectable long-acting formulations refer to biodegradable pharmaceutical polymers synthesized by copolymerization of lactide and glycolide monomers, featuring good biocompatibility, controllable degradation and sustained drug release performance. These products are typically supplied in a range of lactide/glycolide ratios, molecular weights, inherent viscosities and end-group structures to support different release profiles and formulation stability requirements. This market focuses on high-purity pharmaceutical-grade PLGA polymers used in injectable controlled-release drug delivery systems, including long-acting injectables, sustained-release microspheres, in-situ forming depot systems, biodegradable drug-eluting implants and nanoparticle drug delivery systems.

On the demand side, long-acting drug delivery has become an important approach for pharmaceutical companies to improve patient adherence, extend product life cycles and differentiate formulations. Therapeutic areas such as central nervous system disorders, endocrinology, oncology supportive care, addiction treatment and chronic disease management all create demand for injectable controlled-release products. This is driving pharmaceutical companies and formulation CDMOs to procure high-purity,

customizable and registration-ready PLGA materials. Compared with medical device-grade or research-grade PLGA, injectable pharmaceutical-grade PLGA requires stricter control over purity, molecular weight distribution, end-group chemistry, residual monomers, residual solvents and endotoxin levels, supporting its premium pricing and strong customer stickiness.

From a competitive perspective, the global high-end pharmaceutical-grade PLGA market remains concentrated among a limited number of suppliers in Europe, the United States and Japan. Companies such as Evonik, Corbion, Ashland, SEQENS and Mitsui Chemicals hold advantages in product portfolios, quality systems, regulatory support and customer validation. Chinese suppliers are entering the market through pharmaceutical excipient registration, injectable-grade product development and domestic substitution opportunities, but still need to strengthen their capabilities in batch consistency, scale-up quality control, international regulatory support and commercial customer validation. Future competition is expected to focus less on price and more on regulatory documentation, customization capability, supply reliability and deep integration with formulation development projects.

Overall, this is a high-quality niche market with strong research value and solid customer interest. The global market size is estimated at approximately US\$72 million in 2025 and is expected to reach around US\$82 million in 2026, with a projected CAGR of about 12.6% from 2026 to 2032. Given the long development cycle of long-acting injectables, the high cost of material replacement and the limited number of qualified suppliers, this market is not a large-volume commodity segment, but it is well suited as a focused research topic within high-end pharmaceutical excipients, complex formulation upstream materials and drug delivery materials.
