According to our (Global Info Research) latest study, the global Higher Fatty Alcohol market size was valued at USD 1226.9 million in 2023 and is forecast to a readjusted size of USD 1595.9 million by 2030 with a CAGR of 3.8% during review period.

Fatty alcohols (or long-chain alcohols) are usually high-molecular-weight, straight-chain primary alcohols, but can also range from as few as 4–6 carbons to as many as 22–26, derived from natural fats and oils. The precise chain length varies with the source.[1][2] Some commercially important fatty alcohols are lauryl, stearyl, and oleyl alcohols. They are colourless oily liquids (for smaller carbon numbers) or waxy solids, although impure samples may appear yellow. Fatty alcohols usually have an even number of carbon atoms and a single alcohol group (–OH) attached to the terminal carbon.

Some are unsaturated and some are branched. They are widely used in industry. As with fatty acids, they are often referred to generically by the number of carbon atoms in the molecule, such as 'a C12 alcohol', that is an alcohol having 12 carbons, for example dodecanol.
