Abstracts

The global High Q Ceramic Capacitors market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A high-Q ceramic capacitor is a capacitor whose main feature is a high quality factor (Q-value), that is, a low loss factor, which can generate less energy loss in the circuit. This kind of capacitor is usually made of ceramic dielectric material, which can withstand high temperature and high frequency, so it is widely used in high frequency circuits and radio frequency circuits. The Q value refers to the quality factor of the capacitor at a certain frequency. The higher it is, the lower the loss of the capacitor and the better the performance. High-Q ceramic capacitors are usually made of high dielectric constant ceramic materials, such as barium titanate, strontium titanate, calcium titanate, etc. These materials have excellent dielectric properties and stability, and have low energy loss in high-frequency environments, so they are suitable for making capacitors with high quality factors. High-Q ceramic capacitors are widely used in radio, television, radar, communication, measuring instruments and other fields, and can be used to make capacitive components in circuits such as resonators, filters, couplers, and power amplifiers.
