According to our (Global Info Research) latest study, the global High Quantum Efficiency Imaging Sensor market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Quantum efficiency (QE) is a measure of how effectively an imaging device converts incident photons into electrons. For example, if a sensor has a QE of 100% and is exposed to 100 photons, it will produce 100 electronic signals. In practice, sensors are never 100% effective, and different sensor technologies have different QE values. The most high-end scientific cameras can achieve QE of up to 95%, but this depends on the wavelength of the light being detected.
