## Abstracts

The global High Refractive Glass Microsphere for Transportation market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The raw material for making the high refractive glass microsphere for transportation is usually glass, which is made into small spherical particles after special treatment. Its main features are high refractive index and uniform color distribution, which can produce a bright reflective effect under car lights. At the same time, due to its uniform shape and size, it can also achieve clear, continuous and consistent marking patterns.

The high refractive glass microsphere for transportation is a material used for road markings. Its main function is to increase the reflectivity of road markings, thereby improving the driver's recognition of the markings at night or under low-light conditions and reducing the incidence of traffic accidents.
