Abstracts

High Resolution Melting (HRM) is a unique, homogeneous, close-tube, post-PCR technique, empowering genomic scientists to break down hereditary varieties (SNPs, transformations, methylations) in PCR amplicons. High Resolution Melt or HRM investigation as it will be alluded to in this is an enormously effective procedure for the identification of changes, polymorphisms and epigenetic contrasts in twofold stranded DNA tests.

According to our (Global Info Research) latest study, the global High Resolution Melting Analysis market size was valued at USD 81 million in 2022 and is forecast to a readjusted size of USD 116.5 million by 2029 with a CAGR of 5.3% during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Increasing investment in R&D, growing applications of this technology in epigenetics, and mutation scanning are some of the factors propelling the market growth. Benefits such as no use of probes, closed tube system, prevention of post-PCR sample contamination, and high accuracy of melting profile analysis are driving the HRM analysis market growth.
