## Abstracts

According to our (Global Info Research) latest study, the global High Resolution Scanning Tunneling Microscopes market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Scanning tunneling microscopy is a type of scanning probe microscopy. Based on the detection of the magnitude of the tunneling current between the probe and the surface, fluctuations at the single-atom level on the surface can be observed. In addition, scanning tunneling microscopy can use probe tips to precisely manipulate individual molecules or atoms at low temperatures, so it is not only an important micro-nano scale measurement tool, but also a potential micro-nano processing tool. It is an instrument that uses the quantum tunneling effect to detect the surface structure of matter.
