## Abstracts

The global High Resolution Structured Light Camera market size is expected to reach \$ 1242 million by 2032, rising at a market growth of 13.9% CAGR during the forecast period (2026-2032).

High resolution structured light cameras are imaging devices utilizing encoded grating pattern projection technology and high-pixel sensors, with their high-resolution characteristics reflected in the ability to output depth data at levels such as 1280x1024 or even 2 megapixels, thereby acquiring extremely delicate surface textures and edge details of objects. Adopting advanced optical imaging and AI algorithms, these devices reconstruct high-density three-dimensional point clouds by calculating the deformation of projected light modulated by the object surface, where the improvement in resolution ensures more complete point cloud details and high imaging quality even at object edges. Compared to low-resolution solutions, high resolution structured light cameras possess significant advantages within close-range usage, capable of generating three-dimensional images with complete details and effectively addressing imaging challenges caused by irregular placement, stacking, or deformation of objects, providing an accurate data foundation for subsequent processing. This high-precision data acquisition method, combined with powerful processing units, can overcome technical challenges such as ambient light interference, metal reflection, and motion blur, ensuring the ability to rapidly and stably output high-quality three-dimensional visual information even in complex scenarios. In 2025, global High Resolution Structured Light Camera production reached approximately 1940 k units with an average global market price of around US\$250 per unit.
