## Abstracts

The global High Sensitivity Metal Detector market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A high sensitivity metal detector is a specialized device that is designed to detect the presence of metal objects that may be hidden or buried beneath the surface of the ground, or within materials such as food, wood, or textiles. High sensitivity metal detectors typically use a coil of wire that generates a magnetic field when an electrical current is passed through it. When the coil is moved near a metallic object, the magnetic field induces an electric current in the object, which in turn produces its own magnetic field. The detector senses this change in the magnetic field and alerts the user to the presence of a metal object. These detectors are often used in security and industrial applications, as well as in treasure hunting and archaeological exploration.

This report studies the global High Sensitivity Metal Detector production, demand, key manufacturers, and key regions.
