According to our (Global Info Research) latest study, the global High-speed Intensity Modulator market size was valued at US\$ 209 million in 2024 and is forecast to a readjusted size of USD 271 million by 2031 with a CAGR of 3.7% during review period.

A high-speed intensity modulator is a device used to convert electronic signals into optical signals. It mainly achieves data encoding and transmission by changing the intensity of the optical carrier. High-speed intensity modulators usually adopt a Mach-Zehnder interferometer (MZI) structure, which responds to changes in the modulated signal by changing the intensity of the light beam. In high-speed communication systems, intensity modulators play a vital role.
