Abstracts

The global High-Temperature Heat Pump Steam Solution market size is expected to reach \$ 1261 million by 2032, rising at a market growth of 5.0% CAGR during the forecast period (2026-2032).

High-temperature heat pump steam solutions refer to a complete energy-saving heating system driven by electricity, based on the reverse Carnot cycle, that absorbs heat from air, groundwater, or low-grade industrial waste heat, raises the heat energy grade to above 100°C after work by a high-temperature compressor, heats feedwater through a condenser, and produces low- to medium-pressure industrial saturated steam under the action of a flash evaporator/steam compressor. This system is used to replace or partially replace gas/coal/electric boilers to provide process steam for industrial production, achieving an energy efficiency level of COP 1.5 to 3.0 or higher and near-zero on-site carbon emissions.
