Abstracts

The global High Temperature Silver Paste market size is expected to reach \$ 10670 million by 2032, rising at a market growth of 4.9% CAGR during the forecast period (2026-2032).

In 2025, global high temperature silver paste production reached approximately 8700 tons, the average price is 840 usd/kg. High temperature silver paste is a paste type conductive material made of silver-based conductive phase such as silver powder and silver flake as the core, glass phase, inorganic bonding system, organic carrier, solvent and functional additives. It is usually deposited on the surface of silicon wafer, ceramic, glass and other inorganic substrates by screen printing, dot coating or other film forming processes, and sintered at 500° or above.(>500°, mainstream 700-900 °) or after firing to form a functional layer with conductive, adhesion, interconnection, electrode or terminal functions. It is not a single metal slurry in essence, but a composite functional material with synergistic optimization of conductive phase, sintering activity, interface wetting, thermal matching and rheological properties.

Market Concentration and Key Players:

Internationally, the market concentration of high temperature silver paste is relatively high, mainly concentrated in developed countries such as Europe, America and Japan. For example, Heraeus Electronics and Namics and other large manufacturers; from the domestic point of view, the manufacturers of high temperature silver paste are Changzhou Juhe New Materials and Dike Electronic Materials.

Manufacturing Processes and Market Trends:

The core difference between the manufacturing process of high temperature silver paste and low temperature silver paste lies in that the sintering temperature is higher, and the technological process is also based on physical mixing method. Firstly, inorganic binders such as micron or submicron silver powder, glass powder and other organic carriers are premixed at a specific ratio, and then fine grinding is carried out by using a high intensity three-roll mill to realize uniform dispersion of each component and achieve the required fineness. Finally, the finished product is obtained by filtering and defoaming. The formulation of glass powder and the morphology control of silver powder are the key technologies to determine the conductivity and adhesion after sintering.

In terms of market trends, the demand for high temperature silver paste has been closely bound to the crystalline silicon solar cell market for a long time. Especially with the popularization of PERC technology and the rapid expansion of current TOPCon battery capacity, the demand for high performance high temperature silver paste continues to be strong. The technology evolution mainly focuses on reducing silver consumption, improving conductivity efficiency and adapting to the specific needs of N type batteries, such as developing printing capabilities with thinner line diameters. Although international enterprises occupy an important position in the high-end market by virtue of their first-mover advantage, domestic suppliers have achieved full localization and dominated the market share. The future development direction includes further optimizing the slurry formulation to improve efficiency, promoting lead-free to comply with environmental regulations, and expanding its application in other electronic component fields.
