The high temperature thermal dilatometer is an experimental instrument commonly used in the field of materials research. Its working principle is based on the fact that after the electric furnace heats up, the sample in the furnace expands, and the test rod pressed against the end of the sample produces an equivalent displacement. quantity. It is mainly used to test the expansion coefficient of substances at different temperatures to study the thermal expansion characteristics of materials. It is especially suitable for performance testing of inorganic materials such as quartz, corundum, refractory materials, ceramics, glass, graphite, and metal products.
