The global High Temperature Water Source Heat Pump Units market size is expected to reach \$ 1266 million by 2032, rising at a market growth of 5.2% CAGR during the forecast period (2026-2032).

The high-temperature water source heat pump unit is a highly efficient and energy-saving device that uses low-level heat energy such as surface water, groundwater or industrial waste heat as a heat source, and realizes heat extraction and heating through a compressor system. The unit can operate stably at a lower ambient temperature by adopting efficient and environmentally friendly refrigerants, new compression technology and heat exchange materials, and realizes the dual supply of cold and heat. The high-temperature water source heat pump not only has the advantages of high operating efficiency, energy saving and environmental protection, and long service life, but can also effectively replace high-energy consumption equipment such as boilers and reduce carbon emissions.
