High-temperature water source heat pump is a highly efficient and energy-saving equipment specially designed to produce high-temperature hot water. It is suitable for industrial heating, commercial hot water supply and large-scale building heating. The system extracts low-grade heat energy from groundwater, surface water or wastewater, and raises the water temperature to 60°C or even higher through the action of compressors and heat exchangers to meet various high-temperature requirements. High-temperature water source heat pump has higher energy utilization efficiency and lower operating costs, and almost no greenhouse gas emissions, which meets green building standards. Efficient heat exchange technology and advanced control systems ensure the optimal operation of the system under different working conditions.
