According to our (Global Info Research) latest study, the global HIGH TG PCBs market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

High Tg PCB is a PCB assembly with a glass transition temperature of 170°C. When the temperature rises to a certain area, most of the materials will change from the 'glass state' to the 'rubber state'. The temperature at this time is called the glass transition temperature (Tg) of the plate. That is, Tg is the maximum temperature (?) at which the base material maintains rigidity. At this time, ordinary PCB substrate materials will not only soften, deform, melt, etc. under high temperatures, but also show rapid decline in mechanical and electrical properties. Tg value, the stronger the plate's resistance to deformation, the better its dimensional stability.
