Abstracts

According to our (Global Info Research) latest study, the global High-Throughput Liquid Formulation System market size was valued at US\$ 578 million in 2025 and is forecast to a readjusted size of US\$ 968 million by 2032 with a CAGR of 7.6% during review period.

In 2025, global sales volume of high-throughput liquid formulation system was approximately 6,240 units, with a mainstream ex-factory price of around USD 90,000 per unit. The gross margin of major manufacturers in the industry was approximately 35%?55%.

A high-throughput liquid formulation system is an automated liquid preparation device designed for R&D experiments and formulation screening. It is mainly used to precisely meter, automatically dispense, mix, aliquot, and record multiple liquid raw materials, solvents, additives, reagents, or functional components according to preset formulations. The system is typically composed of liquid storage modules, pipetting or pump-valve dispensing modules, gravimetric metering modules, sample-position platforms, mixing modules, temperature-control or shaking modules, control software, and data management systems. It can prepare multiple groups of samples with different ratios in a single workflow, significantly improving formulation development efficiency, dispensing accuracy, and experimental reproducibility. Compared with manual liquid preparation, its core advantages lie in reducing human error, increasing sample processing throughput, and supporting batch, standardized, and traceable preparation of complex formulations.

High-throughput liquid formulation system is mainly used in battery material,

biopharmaceutical, chemical material, and analytical testing fields. In battery material R&D, they can be used for multi-formulation screening of electrolytes, additive systems, and functional material solutions. In the biopharmaceutical field, they are used for reagent preparation, sample pretreatment, drug screening, and reaction system construction. In chemical material R&D, they support the development of coatings, resins, catalysts, polymers, and functional liquid formulations. In analytical testing, they are used for automated preparation of standard solutions, dilution solutions, and test samples. With shorter new material development cycles, increasing laboratory automation, and growing demand for formulation screening, this type of equipment is developing toward higher throughput, higher precision, multi-module integration, digital data management, and better compatibility with complex liquid systems.
