Abstracts

High-throughput screening (HTS) assay is a method used in drug discovery and other fields to quickly and efficiently test a large number of compounds or samples for a specific biological activity. HTS assays are typically automated and can screen thousands to millions of compounds in a relatively short amount of time. HTS assays are often used in the early stages of drug discovery to identify potential lead compounds that show promising activity against a target of interest. These assays can be used to screen for a wide range of biological activities, such as enzyme inhibition, receptor binding, or cell-based assays. There are several different types of HTS assays, including biochemical assays, cell-based assays, and phenotypic assays. Biochemical assays measure the activity of a specific enzyme or protein, while cell-based assays use living cells to measure the effect of compounds on cellular processes. Phenotypic assays measure a specific observable phenotype, such as cell growth or morphology. Overall, HTS assays are a powerful tool in drug discovery and other fields, allowing researchers to quickly and efficiently screen large libraries of compounds to identify potential drug candidates.
