According to our (Global Info Research) latest study, the global High Throughput Screening market size was valued at USD 12360 million in 2023 and is forecast to a readjusted size of USD 16390 million by 2030 with a CAGR of 4.1% during review period.

High-throughput screening (HTS) is a method for scientific experimentation especially used in drug discovery and relevant to the fields of biology and chemistry. Using robotics, data processing and control software, liquid handling devices, and sensitive detectors, High-Throughput Screening allows a researcher to quickly conduct millions of chemical, genetic or pharmacological tests.

Based on technology, the label-free technology segment is expected to grow at the highest CAGR during the forecast period. The major advantage offered by label-free technology is that it can help in the study of varied cell types and targets. Label-free assays also provide simple methods for studying complex biological pathways. The label-free technology is set to reduce drug failure caused by toxicity. These factors are likely to boost the growth of this technology market.
