Abstracts

High viscosity mixers are mixers designed for mixing materials with laminar mixing processes because the ingredients have such high viscosities that a turbulent mixing phase cannot be obtained at all or cannot be obtained without a high amount of heat. The process can be used for high viscosity liquid to liquid mixing or for paste mixing combining liquid and solid ingredients. Some products that may require laminar mixing in a high viscosity mixer include putties, chewing gum, and soaps. The end product usually starts at several hundred thousand centipoise and can reach as high as several million centipoise.

This report studies the global High Viscosity Mixers production, demand, key manufacturers, and key regions.
