High-voltage dynamic reactive power compensation device is a kind of equipment used in power system. Its main function is to provide fast and continuous reactive power support in high voltage transmission or distribution network. Reactive power is the part of an AC power system that flows back and forth between a source and a load without doing actual electrical work, primarily to establish and maintain electromagnetic fields in the circuit. However, too much or too little reactive power will affect the stability and efficiency of the power grid, resulting in voltage fluctuations, power factor degradation and other problems.
