The global High Voltage Electrospinning Machine market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

High-voltage electrospinning machine is a device based on electrospinning technology to prepare ultrafine fibers by spraying polymer solution or melt in a strong electric field. A high-voltage electrospinning machine generally consists of three parts: a high-voltage power supply, a spinneret and a receiving device. The surface tension of the polymer and the charged droplets are in balance at the end of the spinneret. As the voltage increases, the droplets are gradually elongated to form a cone (Taylor cone). When the electric field increases to a critical value, the charge repulsion is greater than the surface tension, and the jet is ejected from the surface of the Taylor cone. The jet flow successively undergoes a stable and unstable elongation process, becoming longer and thinner, and at the same time, the solvent volatilizes and solidifies, and is arranged on the receiving device in a random manner to form a fiber mat.
