Abstracts

The global High Voltage PTC Heater market size is expected to reach \$ 572 million by 2032, rising at a market growth of 4.5% CAGR during the forecast period (2026-2032).

In 2025, global high voltage PTC heater production reached approximately 257 k units, the average price is 1590 usd/unit. High voltage PTC heater is a kind of electric heating device based on positive temperature coefficient thermistor material. It is specially designed for high voltage platform. Its core characteristic is self-temperature control ability. When the temperature is low, its resistance value is small, and it quickly generates heat after being energized. As the temperature rises to a specific Curie point, its resistance will increase sharply, thus automatically limiting the current, stabilizing the heating power, and preventing overheating.

Market Concentration and Key Players:

Internationally, the market concentration of high-pressure PTC heaters is relatively high, mainly concentrated in developed countries such as Europe, America and Japan. For example, large manufacturers such as BorgWarner and Eberspächer; from the domestic point of view, there is still a lot of room for development of high-pressure PTC heaters.

Manufacturing Processes and Market Trends:

The manufacturing process of high voltage PTC heater starts from the preparation of high performance PTC ceramic chip, which obtains stable Curie temperature and resistance characteristics through accurate batching, molding and sintering, then covers silver electrodes on both sides of the chip and reliably connects with electrode lead-out

terminals through welding, and the key packaging process adopts high thermal conductivity insulating materials such as silicone gel for potting to realize close combination with external heat dissipation components and ensure high voltage insulation and moisture resistance. The final product is assembled, aged and subjected to rigorous electrical safety testing.

The market trend is deeply bound to the high-voltage process of new energy vehicles. With the popularization of 800 V high-voltage platform models, the demand for PTC heaters with higher voltage, faster thermal response and higher power density has soared. Energy efficiency improvement and system integration are the main development directions, which are embodied in the high integration of the same controller and thermal management pipeline to save space and reduce costs. At the same time, new electrode pastes with low silver content and better packaging materials are continuously developed to meet the cost pressure and reliability requirements. The focus of future competition is to further reduce the volume and weight, improve the power stability in a wide voltage range, and realize more accurate coordination with the vehicle thermal management system through intelligent temperature control algorithm.
