Abstracts

Highly reactive polyisobutylene (HIPP) is a polymer made from the polymerization of isobutylene monomer (isopentene). It usually has a highly branched structure and therefore has good fluidity, cold resistance and elasticity. HIPP is commonly used in the rubber industry, especially in tire manufacturing. It can be used as one of the components of tire compounds to help improve tire performance such as wear resistance, fatigue resistance and aging resistance. Due to its high activity and branched structure, HIPP is able to maintain good elasticity at low temperatures and good stability at high temperatures. In addition, HIPP is also used in the production of other rubber products, such as seals, pipes, hoses, etc. It can also be used as a modifier and added to other polymers to improve their properties, such as enhancing tear resistance and improving heat resistance. In general, highly reactive polyisobutylene is an important rubber raw material with broad application prospects and plays an important role in the tire and other rubber products industries.
