Abstracts

The global HIPS 3D Printing Filament market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

HIPS 3D printing filament is a 3D printing material of high impact polystyrene. HIPS is a common thermoplastic polymer with good toughness and impact resistance.

Here are some important features and applications about HIPS 3D printing filament:

Support material: HIPS is often used as a support material in 3D printing. It can be used with other printing materials such as ABS to fill voids and support overhangs during printing. Unlike PVA, HIPS is not water-soluble, so after printing, the support structure can be either chemically dissolved (e.g. with D-limonene) or mechanically removed.

Impact resistance: HIPS has excellent impact resistance and is able to absorb and disperse impact energy. This makes HIPS 3D printing filaments useful in the manufacture of parts and assemblies that require impact resistance, such as protective covers, housings, and packaging materials.

Machinability: HIPS has good machinability and is easy to cut, drill and process. It can also be thermally welded and glued for easy assembly and repair.

Good surface quality: The surface of the model printed by HIPS 3D printing filament is smooth and has good detail display, making it suitable for applications that require a high-quality surface, such as display models, artwork and prototyping, etc.

HIPS 3D printing filament is mainly used in model printing that requires support

structure and impact resistance. It is used in a wide range of fields such as automotive, electronics, packaging and consumer goods. Combined with other printing materials, HIPS can provide a stable support structure for complex models and is easy to remove after printing.
