Abstracts

The global HJT Silver Powder market size is expected to reach \$ 1138 million by 2032, rising at a market growth of 3.4% CAGR during the forecast period (2026-2032).

HJT silver powder is high-purity silver powder engineered as the conductive functional phase in low-temperature cured/sintered Ag pastes for silicon heterojunction (HJT/SHJ) solar cells. Because HJT stacks (a-Si:H / TCO) are temperature-sensitive, HJT metallization relies on low-temperature paste routes (typically below ~250 °C), so powder morphology/PSD/surface state are tuned for dense percolation and good contact on TCO at low thermal budgets.

Upstream, PV-grade Ag powder is commonly made from high-purity Ag feedstock via wet-chemical reduction routes (using surfactants/dispersants to control particle size/morphology and agglomeration), among other industrial methods.

Downstream, the powder is formulated with binder resin/solvents/curing agents (and sometimes other functional components) into low-temperature silver pastes for screen-printed front/rear grids of HJT cells; low-temperature Ag pastes are typically composed of metal particles plus resin/solvent/curing systems.

In 2025, global sales of HJT silver powder reached approximately 937 tons, with an average global market price of around US\$ 925/kg. Production capacity varies significantly among manufacturers, with gross profit margins ranging from approximately 3% to 15%.

This report studies the global HJT Silver Powder production, demand, key manufacturers, and key regions.
